European gas, wind and solar – an optimal configuration?

Europe's wind, solar and gas associations are holding formal talks in an attempt to agree policy recommendations aimed at developing markets and regulation to reward renewables and flexible gas-fired generation, which they see as the optimal combination for Europe's future energy mix. The talks come against a background of concern that beleaguered utilities, market disincentives and grid system volatility could endanger the ongoing move towards a smarter, lower-carbon and better distributed power system in Europe. Gas Strategies speaks to some of the participants in this process and assesses the outlook for a more unified energy system.
