Gas helps keep global CO₂ emissions flat for third year

Stronger gas-fired power generation in the US and China has helped keep global carbon emissions flat for a third year, the Global Carbon Project (GCP) said on Monday in its latest annual report.

Carbon dioxide (CO₂) emissions from burning fossil fuels and making cement were unchanged in 2015 at a combined 36.4 gigatonnes (Gt), equal to roughly 36.4 million tonnes. The figure is projected to increase by 0.2% this year, the GCP said.
